

SmartCEMS[®] Server

Product Overview

The **SmartCEMS[®] Server package** is a set of software tools and a platform to gather PEMS data from various sources such as CMC's SmartCEMS PEMS Analyzer, Continuous Parametric Monitor, Alternative Emission Monitor, and Compliance Assurance Monitor and from remote connected hardware devices such as CMC's Remote Terminal Unit. The system gathers all compliance emission data and allows for generation of reports and compliance submittals from one location. Clients can access the server over the network and the reporting features can be enabled to be viewed via web applications.

The SmartCEMS Server package includes training, development tools and platform, and source code to allow for customization of the PEMS product line. Products configured with the developer package include PEMS Analyzer, Continuous Parametric Monitor, Alternative Emission Monitor, and Compliance Assurance Monitor. The software is easy to setup and configure with a non-proprietary user interface and other advanced features that make it cost effective to maintain. The server application is provided with configuration utilities for all PEMS at the site and training along with custom report generation utilities.

Product Features

HARDWARE SPECIFICATIONS

- CMC PEMS software development version
- CMC PEMS configuration tools development version
- Platform software and development tools
- Training for up to five (5) persons
- Support for one year
